

Policy Hacker: Test Task

We're a small team, and a big part of our week goes into manual monitoring and matchmaking. Your job will be to fix that and proactively think of solutions to make all our work more efficient.

Task 1: Policy monitoring (build a prototype)

We spend about 5 hours a week checking these sources for anything relevant to startups:

- [Saeimas komisiju darba kārtības](#)
- [TAP portāls](#)
- [Valsts sekretāru sanāksme](#)
- [Ministru kabineta protokoli](#)
- [Ekonomikas ministrija](#)
- [LIAA](#)
- [Altum](#)

Most of that time goes into reading long documents just to decide whether they matter.

Build a prototype that cuts the time wasted checking these manually and gives info in the most efficient way. You decide what counts as "startup-relevant" and tell us your definition.

At minimum: cover at least 3 of the sources above (TAP portāls must be one of them), and deliver the result as a digest.

Task 2: Startup matchmaking (approach and architecture only)

Every week we get more than 10 requests asking us to point to suitable startups. They come from event organisers, open calls and investors looking for deals. We have a database of 600+ startups with their public information, kept in an Excel spreadsheet, and matching takes about 7 hours a week.

In no more than 2 pages, describe how you would automate this.

Cover:

- the architecture and data flow, from incoming email to a shortlist that has been sent out
- which tools and programs you'd use and why, plus an estimate of monthly running costs
- how you'd keep the database current and the matches accurate
- where a human stays in the loop or how you'd verify match quality
- what you'd ship in week 1 compared with month 3

What to submit

- A link to the repo or working tool, with a short README explaining how to run it (Task 1)
- A 3 max minute screen recording of the Task 1 prototype running on real data
- Sample digest output from Task 1
- The Task 2 write-up as a PDF or doc

You can write in English or Latvian. Use any tools you like, AI included - we expect it. We value something that works. Please don't go far beyond 6 hours.
